

Frontier Model Decision: Deploy, Restrict, or Pause?

Day 6B: Comparing Voluntary Safety Frameworks

Hypothetical. A frontier model has crossed internal high-capability thresholds in cybersecurity and biological assistance. Evaluations indicate a material increase in the ability of non-experts to cause severe harm, although the probability and real-world transfer remain disputed. Safeguards reduce measured misuse but have not been validated at full scale. Leadership believes a competitor may release a comparable model within four months.

Decision Options

- continue development but do not deploy;
- deploy only to screened users under restrictive controls;
- deploy broadly with safeguards and monitoring;
- pause further capability development until stronger safeguards exist.

Framework Comparison

Use Anthropic RSP v3.0, the TIME reporting, and OpenAI's Preparedness Framework.

Question	Anthropic RSP v3.0	OpenAI Preparedness Framework
What capability trigger matters?		
What safeguard standard applies?		
Who evaluates residual risk?		
Who makes the final decision?		
What is disclosed publicly?		
What external review exists?		
How does competitor behavior matter?		
What happens if safeguards are inadequate?		

Board Recommendation

Your team is the independent risk committee advising the board. Recommend one decision and specify:

1. the minimum evidence needed before deployment;
2. the deployment restrictions and monitoring required;
3. what must be disclosed publicly;
4. whether the commitment is credible without external enforcement;
5. how competitor release should or should not change the decision.

Adversarial Review

Another team will challenge your recommendation from one perspective: catastrophic-risk prevention, scientific and commercial competition, democratic accountability, or international security.

Central Question

Can a firm make a credible commitment to restraint when the commitment is self-defined, management retains final authority, and competitors can change the perceived cost of compliance?
