

AI Audit

Evaluating AI Advice for a Business Decision

Purpose. Compare three AI answers to the same business problem. Decide which answer is the best starting point, which claims create risk, and what a manager should check before taking action.

Instructions. Read the case and the three AI answers. Then discuss them with your team. Do not use an LLM or outside sources. A clear, detailed, or confident answer is not always a reliable answer.

The Case: Apex Medical

Apex Medical has developed **CarePilot**, an AI system that writes draft clinical summaries for doctors. The company planned to launch CarePilot across France. It has now delayed the broad launch but will continue a limited pilot.

Clinical quality. In the pilot, 6.2% of the summaries included an error or missing detail that could matter for patient care. The company's limit for launch is 3.0%. Most problems occurred in cases involving medication changes or patients with several long-term illnesses.

Data protection. The company has not clearly explained how long patient data will be kept, how people will review the AI's work, or what should happen after a serious problem. These issues must be addressed before a broad launch.

Cost. Human-review costs are 28% higher than the company's target. Reviewers need more time than expected to check the AI's work and deal with difficult cases.

The company has also provided these numbers:

Input	Value
Cases each month	2,400
Review time without AI	18 minutes per case
Review time with AI	7 minutes per case
Reviewer labor cost	\$45 per hour
Cases needing a second 7-minute review	20%

The committee must choose one option:

Broad launch | **Continue the limited pilot** | **Pause the pilot**

Three AI Answers

Response A

Apex Medical should continue with the broad launch. CarePilot was correct in 93.8% of cases. This is strong performance for a new clinical AI product. The French authorities have not banned the product, so the company can complete the missing documents after launch. CarePilot will save about \$237,600 each year in labor costs. Apex should launch the product across France, review its performance each week, and stop using it only if the error rate rises above 10%.

Response B

Apex Medical should pause the limited pilot as well as the broad launch. The error rate is more than twice the company's limit, and the required data-protection work is incomplete. The case does not show how many errors are found during human review, so the pilot may still expose patients to avoidable risk. Apex should not use CarePilot until the error rate is below 3.0% and all documents are complete. This means giving up short-term savings, but patient safety and following the law are more important.

Response C

Apex Medical should continue with a limited pilot. The company should exclude cases involving medication changes or patients with several long-term illnesses, and a person should review every summary produced by the AI. The estimated labor saving is \$19,800 per month before second reviews. The second reviews cost \$2,520 per month, leaving a final estimated saving of \$17,280 per month. Because the errors are concentrated in the excluded cases, these controls should bring the error rate below 3.0%. Before a broader launch, Apex should also complete its data-protection work.

Three Types of Claims

A **supported claim** comes directly from the case or from a correct calculation. A **reasonable inference** is not stated directly but follows logically from the evidence. An **unsupported claim** is not established by the information provided.

Your Team's Task

Your Team's Task

You have **10 minutes**. Choose one person to give a 90-second report.

1. **Which answer provides the best starting point for a decision?** What would you change before using it?
2. **Identify one supported claim, one reasonable inference, and one unsupported claim** from the three answers.
3. **What fact or calculation should a manager verify first** before taking action?

Questions to Help Your Discussion

- Is each important claim supported, inferred, or unsupported?
- Is the calculation correct and complete?
- What could happen if a manager acts on the answer and it is wrong?

Apex Medical, CarePilot, and all facts in this case are fictional and were created for this course.
