

Rebuilding SaaS for an Agentic Era

Day 2A: Product Redesign and Moat Decomposition

Purpose. Redesign a familiar enterprise-software product around an end-to-end customer outcome, then determine whether AI agents weaken or strengthen the incumbent's competitive position.

Team Assignments

Slack, Zoom, Shopify, Salesforce, Asana, Notion, Zendesk, or Workday. If there are more teams, add ServiceNow, HubSpot, Adobe, or SAP.

Part 1: Define the Outcome

What result does the customer ultimately want? State the outcome without naming existing product features.

Customer outcome:

Part 2: Agentic Redesign

Design a system that can pursue that outcome from beginning to end.

Element	Your design
Inputs and context	
Decisions the system makes	
Actions the system executes	
Human approvals and red lines	
Exceptions and failure handling	
Feedback and learning	

Part 3: Moat Decomposition

For each source of advantage, mark whether agents make it **weaker**, **unchanged**, or **stronger**, and explain why.

Potential moat	Effect	Reason
Interface and user habit		
Proprietary data		
Workflow integration		
System-of-record status		
Permissions, trust, and auditability		
Compliance expertise		
Distribution and installed base		
Switching costs		

Required Conclusion

Choose one:

- The incumbent is likely to be **displaced** by an AI-native entrant.
- The incumbent becomes a **commodity data or execution layer**.
- The incumbent is **strengthened** as the trusted system of action.

Defend your conclusion in a four-minute presentation. Your team may use one slide or one whiteboard diagram.
