

Can Europe Close the AI Competitiveness Gap?

Day 5A: Diagnosis, Implementation, and Binding Constraints

Purpose. Determine whether post-Draghi EU initiatives address the structural constraints identified in the report or primarily repackaging existing policies.

Team Assignments

Each team evaluates one constraint: capital, compute, energy, market scale, talent, commercialization, or regulation.

Implementation Matrix

Draghi diagnosis	Subsequent initiative	EU Instrument and scale	Implementation status	Likely effect and remaining gap
------------------	-----------------------	-------------------------	-----------------------	---------------------------------

Evaluation Criteria

1. Does the initiative target the diagnosed mechanism?
2. Is its financial and administrative scale proportional to the problem?
3. Is implementation national, EU-wide, or dependent on private actors?
4. What measurable outcome should change by 2028?
5. Does the initiative create a new capability, remove a constraint, or merely announce coordination?

Cross-Team Negotiation

After team reports, the class has a fixed political budget and may select only **three** priority interventions. Rank the two binding constraints and propose one package that links them.

Required Output

Submit a one-page matrix and a conclusion answering:

Is Europe's central problem inadequate resources, fragmented markets, weak commercialization, regulatory costs, or the inability to coordinate all of them at sufficient speed and scale?
